Curriculum Supplement Series Gaining Insight through Systems Thinking and Computational Modeling

In this set of online activities, high school and college students in statistics, math, computer science, environmental science, physics, integrated science, biotechnology, and STEM courses are prepared to use systems and computational thinking to explore today's complex issues and questions. Lessons may be completed independently or as a class.

Students: If you are interested in using these activities and authoring your own computational models, please see this webpage to get started anytime: <u>https://www.gaininginsight.org</u>.

Teachers: The Baliga Lab at the Institute for Systems Biology has been translating their research into user-friendly curriculum modules since 2004 through the program, Systems Education Experiences (SEE). By forming collaborative teams comprised of students, scientists, engineers and educators, today's research and methods have become accessible, interactive activities for students. These activities work toward bridging the distance between the professional lab, computer science, and the classroom.

The Next Generation Science Standards use two words extensively that are relatively unfamiliar to many teachers. These two words are "Model(s)" and "System(s)". These activities address both systems and model building. Although this is designed as standalone instructional

materials, it is connected to, and builds on, materials and ideas developed in the other SEE units.

In this module, students focus on the role of math and computer-based modeling to learn how dynamic systems models are developed, evaluated, and applied to understand complex scientific issues such as population explosions, food sustainability, cancer, energy, climate change, and ocean acidification. The module is written for students to walk through the activities at their own pace, using their preferred modeling software, such as NetLogo, STELLA, Vensim, and Insight Maker. Once basic dynamic modeling and systems concepts are addressed, students are able to "choose their own adventure" by selecting from a suite of case studies.

Gaining Insight through Systems Thinking and Computational Modeling		
Sample	e of NGSS & Common Core Standards Addressed	Sample of Questions Explored
SEP1	-Asking Questions and Defining Problems	How can we improve our model so that it produces an output that
SEP2	-Developing and Using Models	comes closer to describing our experience with the real world? What do
SEP4	-Analyzing and Interpreting Data	we need to change and add?
SEP5	-Using Mathematics and Computational Thinking	
CCC1	-Patterns	Does the acidification of ocean water affect the organisms at higher
CCC2	-Cause and Effect: Mechanisms and Explanation	trophic levels, for instance reef fish?
CCC4	-Systems and Systems Models	
CCC6	-Structure and Function	What policy or policies can be implemented to change the behavioral
CCC7	-Stability and Change	mode from what is feared, to one that is hoped for?
LS2	-Ecosystems: Interactions, Energy and Dynamics	
ESS3	-Earth and Human Activity	What are the similarities between a cooling cup of coffee and last year's
ETS2	-Links Among Engineering, Tech, Science & Society	flu outbreak at your school?
CCSS	-Define appropriate quantities for the purpose of	
(HSN.	descriptive modeling.	Can you find a "tipping point" where the system collapses?
Q.A.1- 3)	-Choose a level of accuracy appropriate to limitations on measurement when reporting quantities.	How could you make your model more resistant to change?
